Network and IOT Application Project

Room Comfort Temperature Monitoring System

The **Room Comfort Temperate Monitoring System** will monitor the room temperature, and return an alert based on how high or low the temperature is. The system will assign a “comfort score” based on predefined temperature thresholds. These scores will be calculated and returned to the terminal for user to see.

This project will use a Raspberry Pi to monitor room temperature in real time. And the Sense HAT temperature sensor will be used to collect environmental data at regular intervals. Sensor readings and calculated comfort score will be sent using HTTP requests.

Further functionality may be added, time dependant.

Proposed Tools Technologies and Equipment

Equipment:

- Raspberry Pi 4 Model B
- Sense HAT

Technologies:

- Python
- Raspberry Pi OS
- HTTP protocol

Development Tools:

- Visual Studio Code
- Git and GitHub (version control and project submission)
